Your camera roll is a graveyard of intentions.

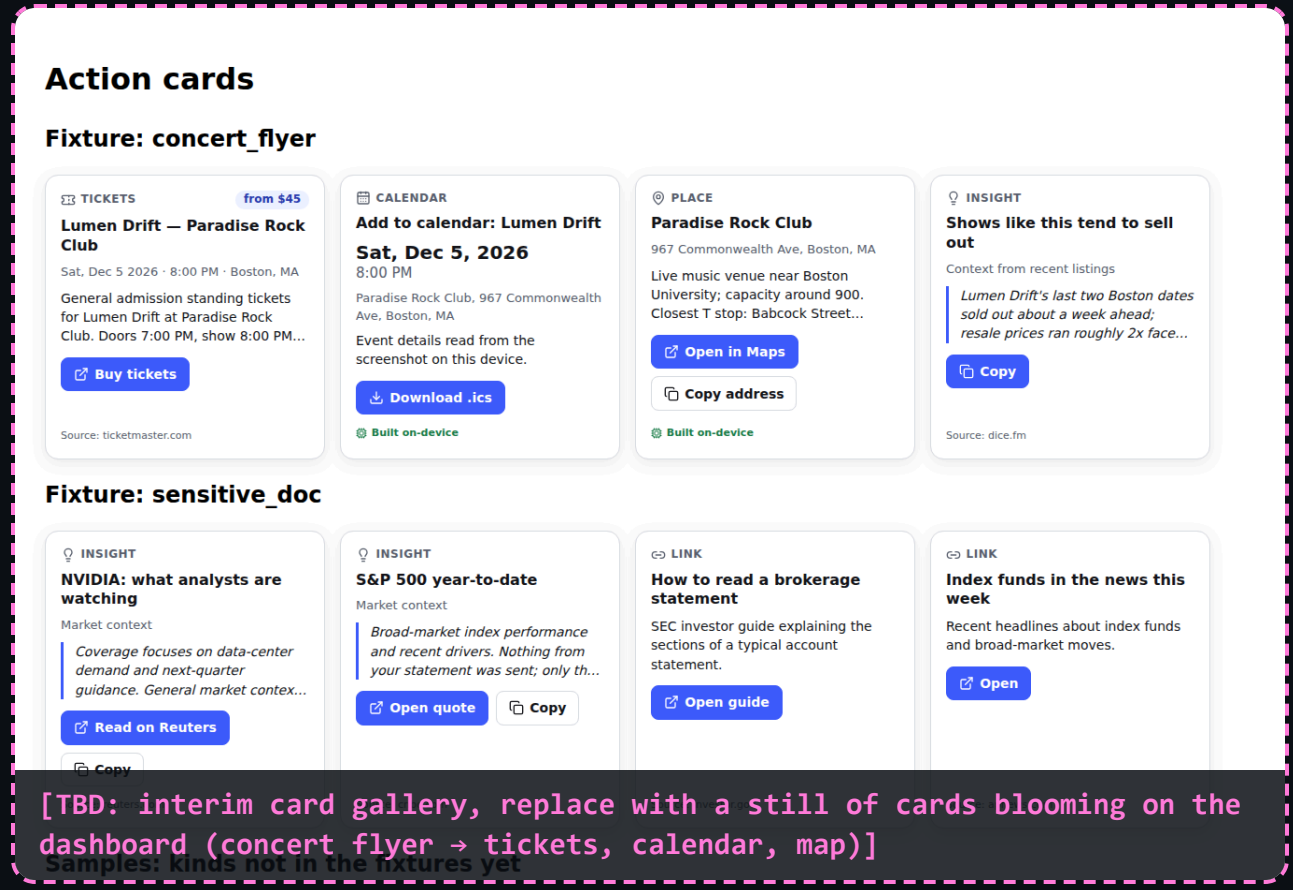

We screenshot the concert we want to go to, the book a friend loved, the chart we meant to read up on. Then nothing happens. The screenshot sits there.

Turning a screenshot into an action today means retyping it, or uploading it to someone's cloud.

Cloud assistants don't work on a work laptop

- The whole image goes to a remote server: names, emails, internal numbers and all.
- NDAs and compliance policies often forbid sending internal material to outside services.
- So the screenshots that matter most at work are the ones you can't send anywhere.

Drop a screenshot. Get actions back.
The image never leaves your laptop.

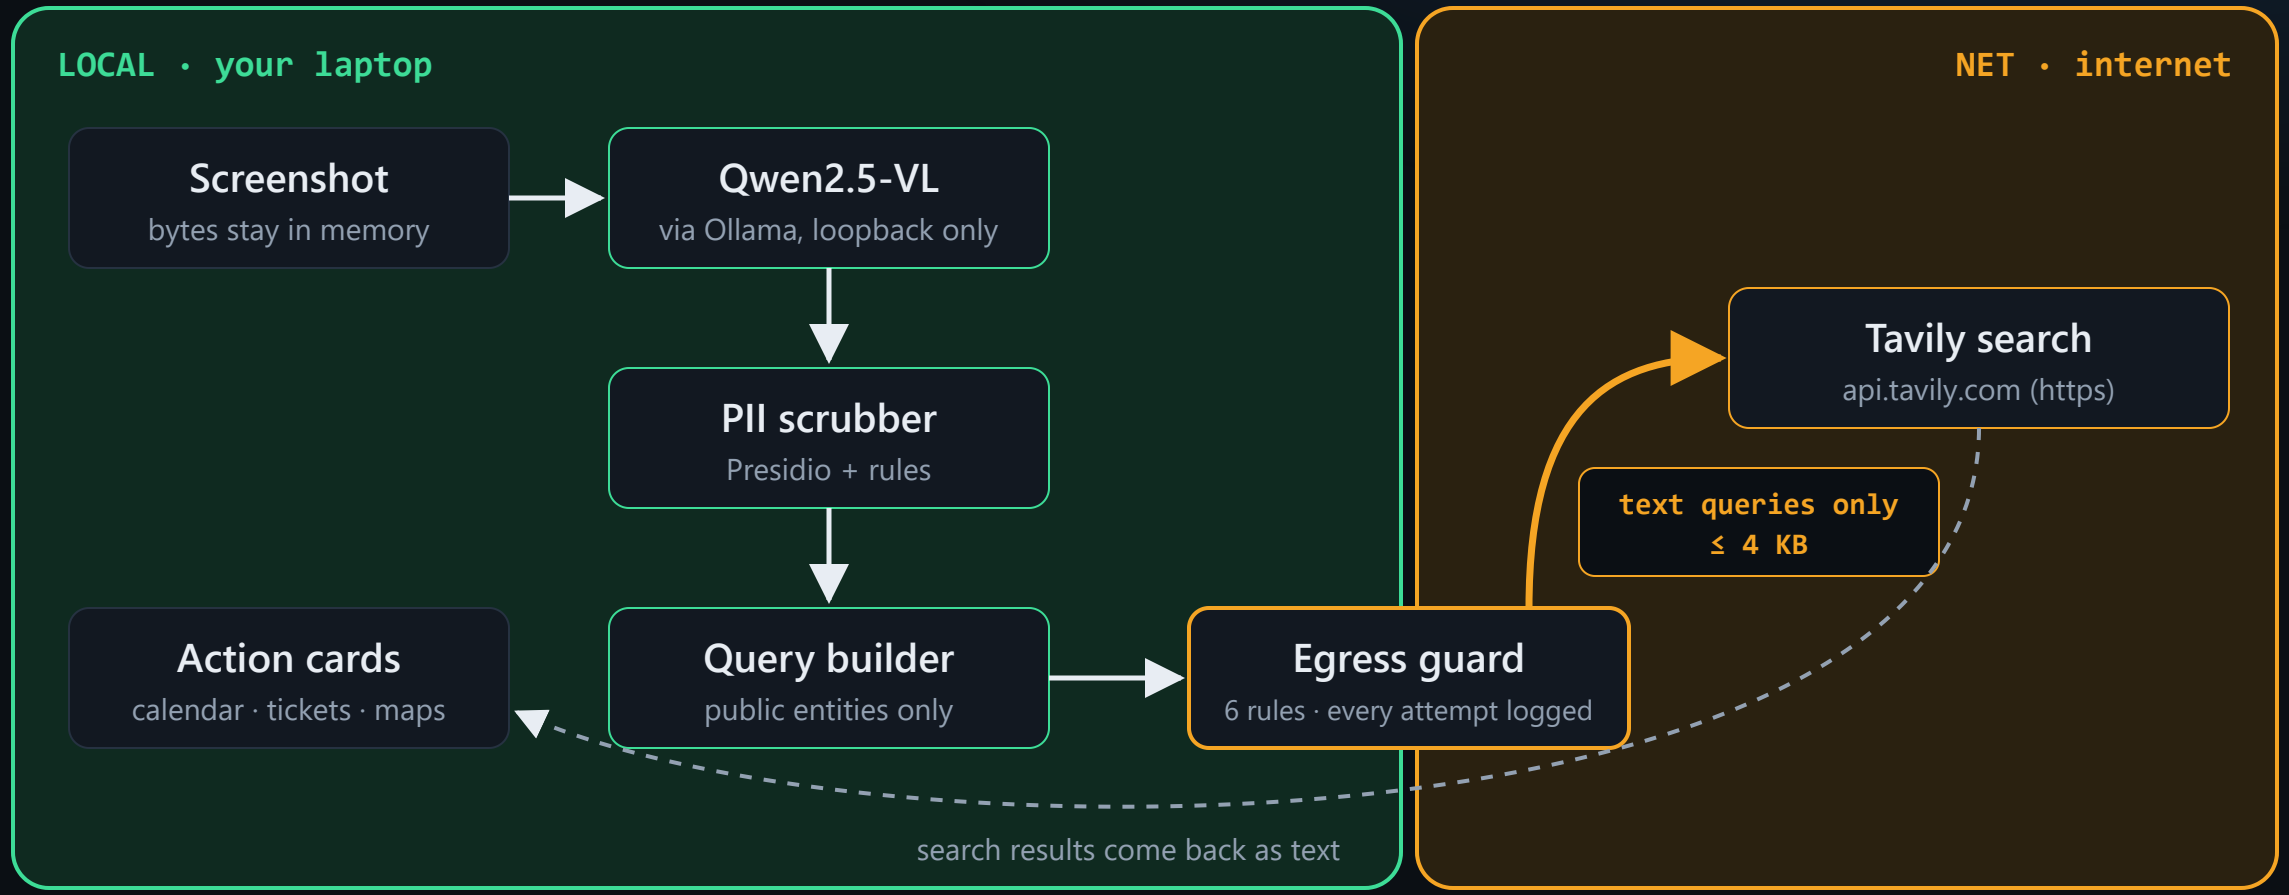

[TBD: interim card gallery, replace with a still of cards blooming on the dashboard (concert flyer → tickets, calendar, map)]

A local vision model reads the screenshot on your machine. Private details are removed. Only a few short public text queries go to the web.

Results come back as cards you can act on: **Add to calendar**, buy tickets, open in Maps.

Two zones. One door between them.

No image or raw text leaves the device — enforced by code and shown in the audit log.

Eval · `eval/results.md`

Images	**10** synthetic, fake PII
Intent accuracy	[TBD: from eval/results.md]
Leaks	[TBD: exact count, do not round]
Scrubber off	[TBD: leaks with --no-scrub]

Egress guard · first failure blocks

1. Air-gap on (`LATENT_OFFLINE`) blocks everything
2. Allow-listed host, https, default port
3. Body ≤ 4096 bytes (an image cannot fit)
4. No base64-looking run of 200+ chars
5. No PII found in any string in the body
6. No API key in the body (headers only)

Source: `backend/app/egress.py`; a test fails if any other module opens a network client.

[TBD: air-gap demo still internal email: extraction done locally, search ✕ blocked in the audit log]

Free for people. Paid for companies.

B2C Affiliate share on the action

- Ticket, shopping and book cards are where intent turns into a purchase.
- Every commercial link already passes through one hook, `affiliate.tag_url`, where a partner tag goes.
- Revenue only on links the user chooses to click; the app stays free.

B2B Enterprise tier (planned)

- **On-prem model**: the vision model runs on company hardware.
- **Policy controls**: admins set the egress allow-list, scrubber rules and air-gap defaults.
- **Audit-log export**: every outbound request, sent or blocked, for compliance review.

Millions of users, and still no screenshot on our servers.

Inference runs on each user's own device, so what we host grows only with the **search proxy, accounts and billing**, never with GPUs or anyone's images.

1 · Desktop app
bundled local runtime, model download sized to RAM

→

2 · Our search proxy
API keys off the device, no query logs, rate limits

→

3 · Enterprise pilot
self-hosted proxy or full air-gap

→

4 · On-device mobile
the same local-first pipeline on phones

Trust at scale

- One egress module; nothing else may open a connection
- Outbound log the user can see
- Leak-test eval on fake-PII screenshots
- Planned: third-party audit, SOC 2

Revenue

- Free tier with a search cap
- Pro subscription
- Affiliate links that carry no user data
- Per-seat enterprise tier

Risks → answers

- **Weak hardware** → smaller model tiers, OCR-only mode
- **Platform owners** → cross-platform, inspectable code, enterprise focus
- **Search cost** → result caching and per-tier caps

Why Latent fits each track

TRACK	HOW WE MEET IT
Privacy-First	Vision runs locally; one egress module with six rules; air-gap switch; audit log of every outbound request and its size; leak eval on fake-PII screenshots.
SURGE · Tavily & Exa	Tavily search turns scrubbed public entities into ticket, shop, book and map cards. Exa related-content cards are our stretch goal (issue #19).
Most Startup-able	A problem everyone has, a free consumer app with affiliate revenue, and an enterprise tier for teams that can't use cloud assistants.

Team

[TBD: names and roles]

What's next

Opt-in auto-ingest from the screenshot folder, a local intent library, Exa related-content cards.

Our ask

[TBD: the ask, e.g. pilot teams or feedback]
